Supplementary Figure 2. Depiction of singing behavior and datasets analyzed for experiments involving bicuculline (BMI). Outlined boxes indicate doses that each bird received. Two birds received only one dose of BMI because experiments had to be discontinued due to probe damage. The black box with "S" denotes an experiment in which infusion of BMI suppressed song (only 1 song produced during the experimental period). We were able to analyze song on the days in which birds produced >10 songs during the experimental period (non-black boxes). To examine the effects of BMI on song structure, we analyzed songs following infusions of the highest dose of BMI examined that did not suppress song; these experiments are indicated with "ND" (non-degraded song).
